TEXAS - JUNE 1954

E. A. Farrell, Section Director - Houston

WEATHER SUMMARY

Temperatures over Texas during June, 1954, were generally near to 2° above normal. A brief cool spell the first part of the month in the northern portion dropped the temperatures to near record values, equaling the all-time low for June at Dallas on the 4th. Precipitation was below normal over most of the State except along the Rio Grande Valley near and above Laredo into the Pecos Valley. The first hurricane of 1954, which moved inland to the south of Brownsville on the 25th, caused heavy rains from Laredo to Del Rio. When this storm reached the Pecos Valley, exceptionally heavy rains occurred, resulting in a disastrous flood on the Rio Grande from the Pecos River to Falcon Dam below Laredo. Heaviest amount during the 48-hour period was 27.1 inches near Pandale.

Showers were well distributed over the month with very few days on which measurable precipitation did not occur somewhere in the State. The lowest temperature for the month was 41° at Hereford on the 3rd. Most stations recorded their monthly minimum temperature on the 4th. The highest temperature for the month was 112° at Boquillas Ranger Station on the 6th and on the 9th. Most stations, however, recorded their monthly maximum temperature on the 30th, although the last half of the month was generally hot with little variation. As the first hurricane of this season moved inland up the Rio Grande Valley on the 25th, exceptionally heavy rains occurred in the Pecos Valley, which resulted in a record-breaking flood on the Rio Grande from the Pecos River to Falcon Dam. Supplemental precipitation data in this area are tabulated elsewhere in this bulletin. The greatest amount for the period June 26-28th was 27.1 inches near Pandale.

Combining wheat started in extreme north High Plains counties and gained momentum in central High Plains and northern Low Rolling Plains counties. Most grain was already out of the field in the southern Low Rolling Plains and northern Blacklands. North of a line about San Angelo, Brownwood, Waxahachie and Marshall, crops and pastures were making very satisfactory development as scattered showers provided additional moisture over most of that area. South of that line, however, feed crops and pastures deteriorated as soil moisture in that area was depleted by growing crops, strong winds and blazing sun. Movement of commercial vegetables from the early sections of South Texas was about over. In North Texas, bulk of the onion acreage was harvested and digging of potatoes was well along. Livestock generally were in good condition, and stock water was adequate throughout the State.

LOCAL STORMS

On the 1st, tornadoes and hailstorms occurred at Bakersfield, Pecos County and numerous communities near Paducah in Cottle County. Tornadoes occurred at Iowa Park, and Wichita Falls, Wichita County and also near Silverton, Briscoe County. Hail was reported in Knox and Baylor Counties. Damage was most severe in Cottle County where crops were damaged to the extent of \$6,611,500 and other property to the extent of \$1,000,000. On the 2nd, a tornado occurred at Lake Creek, Delta County, with the loss of \$10,000 in property with some crop damage; also a tornado which did not reach the ground occurred at Lorena, McLennan County. Wind damage was also reported in Rains and Falls Counties. Hail also damaged crops in Rains County. On the 4th, a windstorm occurred at Presidio with damage amounting to \$7,000. On the 7th, at San Angelo and the North Concho Lake area, a wind and hailstorm left damage amounting to \$1,500,000. Hail damage also occurred at Big Spring, Texas, on the 7th, damage amounting to \$1,025,000. Minor wind and hail damage occurred in Nolan County on the 7th. On the 8th, hail was reported near Muleshoe and near Fort Stockton as well as in north Farmer County. Wind and hail also occurred on the 8th at Borger with damage amounting to \$10,000. On the 10th, hail damaged a heavy proportion of the wheat crop at Hereford. On the 11th, in Swisher, Floyd and Hale Counties, hail devastated the wheat crop and affected 30,000 acres of cotton. On the 11th, also, a tornado and hailstorm occurred in Terlingua with only minor damage since it was sparsely settled ranch land. On the 14th, wind and hail destroyed cotton crops near Big Spring, with crop damage estimated at \$26,000 and other property to the extent of \$110,000. Tornado clouds were reported by pilots on the 19th near Taft and on the 20th near Beaumont; however, neither funnel cloud touched the ground.

FLOOD OF JUNE 26-28, 1954

The flood of June 26-28, 1954 was the greatest of Rio Grande written history. Excessive rains fell over the lower Pecos River valley and adjoining areas to the east on the night of June 26 and morning of June 27. Supplemental precipitation data are tabulated elsewhere in this bulletin. The main rain source was in the Langtry-Sheffield-Ozona area, where as high as 27.1 inches of rain occurred in 48 hours near Pandale. Flash floods in normally dry arroyos washed out highway and railway bridges and fills. The Sunset Limited on the Southern Pacific was stranded with about 266 passengers at Langtry. Some of the passengers were evacuated by helicopter. About 200 automobiles were also stranded at that point. The highway bridge over the Pecos River was washed out. Some damage occurred in the city limits of Del Rio and Eagle Pass, but the major damage was in Laredo. Practically all deaths and the extreme damage to property was on the Mexican side of the River. Flooding also occurred along the Nueces River. Only minor damage occurred on the Nueces as most of the territory flooded was ranch country.--CBC

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- ① Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
- No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in Station Index means after rain.
- B Adjusted to a full month.
- C Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
- R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
- T Trace, an amount too small to measure.
- V Includes total for previous month.
- SS This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, \$1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 8-26-54 -- 1680

CORRECTIONS

- January 1953: Carrizo Springs, Table 2, total precipitation should be 0.00, departure -1.08, greatest day 0.00, days .01 or more 0, days .50 or more 0, and days 1.00 or more 0.
Carrizo Springs, Table 3, delete dashes on the 15th and 22nd. Total should be 0.00.
Denton Exp. Station, Table 2, total degree days should be 421.
- February 1953: La Pryor, Table 2, days with max temperatures 90 or above should be 0.
- March 1953: Callian, Table 3, delete all precipitation amounts and add dashes for all days and the total.
William Harris Res., Table 2, delete total degree days.
- April 1953: Haskell, Table 3, max temperature on the 21st should be 78.
- June 1953: Rio Grande City, Table 2, days with max 90 or above should be 30, max 32 or below 0, min 32 or below 0.
- July 1953: Station Index, delete symbol and note, "Continuation of Fort Worth Meacham Field" record at end of Index.
- November 1953: Rocksprings, Table 2, precipitation departure should be -0.79.
- December 1953: Beeville, Table 6, evaporation on 1st should be -10, 2nd missing, and total 2.95B.
Hye, Table 3, add dashes for all daily amounts and total.
Raymondville, Table 2, mean maximum should be 67.8M, mean Minimum 59.2M, and days with max 32 or below 0.
Raymondville, Table 5, maximum on 19th should be missing and mean 67.8.
- January 1954: Boquillas Ranger Station, Table 2, days with max 90 or above should be 0.
May 1954: Table 2, degree days should be 0 for the following stations: Boquillas Ranger Station, Brownsville WB AP, Laredo WB AP, Mc Allen, and Port Isabel.
